3.2	Exceptions . . . . .	8
	<b>Python Module Index</b>	<b>9</b>

**Flask-Slack** is a Flask extension which makes it easy to interact with Slack slash commands.

# CHAPTER 1

---

## Quickstart

---

You can register your Slack slash command to a method as follows.

```
from flask_slack import Slack

slack = Slack(app)

@slack.command('your_command', token='your_token',
               team_id='your_team_id', methods=['POST'])
def your_method(**kwargs):
    text = kwargs.get('text')
    return slack.response(text)
```

All registered methods are dispatched through `slack.dispatch` method. You can connect it to an endpoint which you wish Slack robots to request with.

```
app.add_url_rule('/', view_func=slack.dispatch)
```

# CHAPTER 2

---

## Installation

---

You can install Flask-Slack with pip:

```
$ pip install flask-slack
```

Or, with setuptools easy\_install in case you didn't have pip:

```
$ easy_install flask-slack
```

# CHAPTER 3

---

## API Reference

---

### Slack

```
class flask_slack.Slack(app=None)

command(command, token, team_id=None, methods=['GET'], **kwargs)
```

A decorator used to register a command. Example:

```
@slack.command('your_command', token='your_token',
                 team_id='your_team_id', methods=['POST'])
def your_method(**kwargs):
    text = kwargs.get('text')
    return slack.response(text)
```

#### Parameters

- **command** – the command to register
- **token** – your command token provided by slack
- **team\_id** – optional. your team\_id provided by slack. You can also specify the “TEAM\_ID” in app configuration file for one-team project
- **methods** – optional. HTTP methods which are accepted to execute the command
- **kwargs** – optional. the optional arguments which will be passed to your register method

#### dispatch()

Dispatch http request to registered commands. Example:

```
slack = Slack(app)
app.add_url_rule('/', view_func=slack.dispatch)
```

#### init\_app(app=None)

Initialize application configuration

**response** (*text, response\_type='ephemeral', attachments=None*)

Return a response with json format

#### Parameters

- **text** – the text returned to the client
- **response\_type** – optional. When *in\_channel* is assigned, both the response message and the initial message typed by the user will be shared in the channel. When *ephemeral* is assigned, the response message will be visible only to the user that issued the command.
- **attachments** – optional. A list of additional messages for rich response.

**validate** (*command, token, team\_id, method*)

Validate request queries with registered commands

#### Parameters

- **command** – command parameter from request
- **token** – token parameter from request
- **team\_id** – team\_id parameter from request
- **method** – the request method

## Exceptions

**class flask\_slack.SlackError (msg)**

Base Slack Exception

**\_\_init\_\_ (msg)**

Return error message to user

**Parameters** **msg** – the error message to return
